Võ Quang Thành

Junior Full-stack Developer

Email: voquangthanh2004@gmail.com
Mobile: +84 363276943
Date of birth: 2004
Portfolio: quangthanhdev.vercel.app
GitHub: github.com/vqt2129a

EDUCATION

Binh Duong Economics and Technology University — Ho Chi Minh City
Bachelor of Software Engineering — **GPA**: 3.25/4.0

SKILLS

- Programming Languages: C#, JavaScript, TypeScript, Kotlin, SQL
- Frameworks & Libraries: Asp.NET Core (Web API/MVC), Node.js (Express.js, NestJS), React.js
- Databases: SQL Server, PostgreSQL, MySQL
- Tools & Technologies: Docker, Redis, Git/GitHub, Postman
- Languages: Vietnamese (Native), English (Technical Reading & Documentation)

EXPERIENCE

MID Viet Nam Company Limited — Ho Chi Minh City

Full-stack Developer (Contractor) — 6/2026 – present

- **Insight Center – Enterprise HRM & Operations Platform**: Architected and built an end-to-end operations platform using Node.js (Express.js), TypeScript, Redis, BullMQ, and React 18 under Domain-Driven Design to unify fragmented enterprise HRM, attendance, leave, and organizational workflows. Engineered dynamic hierarchical RBAC (multi-level org-tree scoping & concurrent appointments), geofenced attendance & shift scheduling, and multi-tier leave approval workflows (SLA escalation, annual leave quotas) with AntV X6 org charts, achieving sub-500ms API p95 latency.

- **Automated Payroll, QA Scoring & Alert Engines**: Designed an automated performance and statutory HRM payroll ecosystem to eliminate error-prone manual spreadsheet tracking across cross-functional teams. Built an interactive @dnd-kit Kanban board with a 7-status state machine (QA gates, bug-reopen penalties, optimistic locking), deterministic statutory payroll services (prorated by timesheets and approved leaves, OT, capped insurance) with row-locked approvals and append-only ledgers, and an idempotent alert engine (MySQL unique generated columns, cron sweeps), cutting monthly payroll reconciliation time by 60% and eliminating calculation discrepancies.

Freelance Web Developer — Ho Chi Minh City

Driving School Web Portal | daotaolaixehiepthanh.vn — 06/2026 – 07/2026

Built an end-to-end web system comprising an SEO-friendly public landing portal (.NET 9 MVC), an Admin SPA Dashboard (ReactJS, Vite), and a centralized Backend API (Node.js, Prisma, SQL Server) to streamline course registrations and website content management.

- **Developed a responsive Single Page Application** (SPA) Admin Dashboard using React 18, Vite, and Tailwind CSS, integrating rich-text editors to manage course offerings, news articles, instructor profiles, and dynamic banners.

- **Configured client-side navigation** with React Router v7 and centralized Axios interceptors to manage JWT authentication flow, token storage, and secure, role-based route protection.

• **Designed and implemented the RESTful API & database schema** on SQL Server using Prisma ORM, implementing soft deletes, transaction validation logic, and password hashing with Bcryptjs.

• **Architected server-side rendered public pages** using ASP.NET Core 9 MVC, connecting to the Node.js API via HttpClient and implementing custom Action Filters, slug-based routing, and dynamic Open Graph/Meta tags to maximize SEO performance.

ITECCOM Technology Company Limited Ho Chi Minh City

Fresher Full-stack Developer 10/2025 – 05/2026

• **Digital Signature Platform:** Designed and implemented a .NET-based digital contract signing platform supporting both single and bulk operations, addressing scalable document processing needs. Developed end-to-end lifecycle management including signer configuration, PDF mapping, dynamic signature placement (image & USB Token), and automated notifications. Architected backend services and optimized SQL Server schemas to handle complex multi-step transactions, reducing manual processing time by 40% and improving system reliability under high-load scenarios.

• **Saigontourist Enterprise CRM:** Enhanced and maintained enterprise CRM systems for loyalty programs and member card management, ensuring reliable customer data operations. Engineered backend services to extract and synchronize near real-time transaction data from the Data Warehouse (DW), reducing data latency and improving data consistency across systems. Optimized data processing workflows using .NET and SQL Server to support high-volume transactions, ensuring stable performance under concurrent workloads.

PROJECTS

Technical Case Study: Enterprise RBAC & Authorization Engine

Tech Stack: Node.js, Redis, BullMQ, Vitest, Docker, MySQL

• **Github**: github.com/vqt2129a/RBAC-Case-Study

• **Architectural Design & Dynamic Data Scoping:** Engineered a Fine-Grained Authorization Engine handling complex access control across multi-level organizational trees (supporting concurrent appointments). Utilized MySQL 8 Recursive CTEs with DAG cycle-detection to dynamically compile hierarchical data scopes (ALL, ORG, OWN) into parameterized SQL predicates.

• **Multi-Tier Caching & Stampede Protection:** Designed and benchmarked a dual-layer caching strategy with Redis MGET by decoupling org subtrees from user auth contexts, slashing authorization latency from 14.2ms to <0.8ms. Implemented an in-memory SingleFlight mechanism to collapse concurrent cache misses, preventing database stampedes during cold starts.

• **Reliable Revocation & Transactional Outbox:** Modeled a 3-tier active cache invalidation pipeline (Synchronous DEL -> BullMQ async retry queue -> Periodic Reconciler) paired with the **Transactional Outbox** pattern, guaranteeing zero-loss cache evictions across role inheritance chains and account lockouts without stale-read vulnerabilities.
